Evaluation of Forecast MQO - Belgium

Bino Maiheu (bino.maiheu@vito.be)

Outline

- » Application for OVL forecast model
- » Suggestions for indicators
- » Additional comments

OVL methodology

Input

- PM10: last measurements (“A”)
- Meteo forecast which determines “B”

Process

- Neural network

Output

- PM10 forecasts (day0, day+N)

Boundary layer height + meteo

OVL methodology

- » Hooyberghs, J., Mensink, C., Dumont, G., Fierens, F., Brasseur, O., 2005. A neural network forecast for daily average PM concentrations in Belgium. *Atmos. Environ.* 39, 3279–3289. doi:10.1016/j.atmosenv.2005.01.050

Sensitivity to OU

- » Target diagram quite sensitive to OU
- » LV = 50, OU = 0, 10, 20 %

Sirtind Ind: 1-8784
 Model (s): OVL1
 Parameter: PM10
 Scen: 2008
 Extra Values: 50./20.
 Season: Year
 Day hours: All 24h
 Time Average: Preserved
 Daily stats: Mean

Evaluation of FA vs. MA

» Improving exceedance predictions in OVL

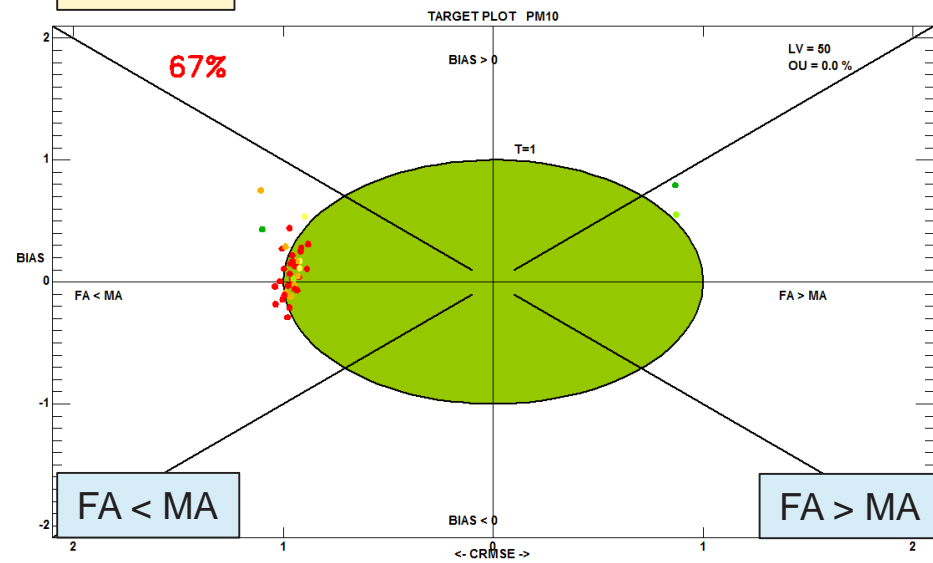

Evaluation of FA vs. MA

» Using 0 % OU, LV 50

Resampled distributions

"As is"

Threshold indicators

FCF :
 Fraction of correctly forecasted exceedances

$$FCF = \frac{N3}{N3 + N4}$$

FFA :
 Fraction of false alerts

$$FFA = \frac{N2}{N2 + N3}$$

FRE :
 Fraction of realized exceedances

$$FRE = \frac{N3}{N2 + N3}$$

SFN :
 Skill of forecasting non-exceedances

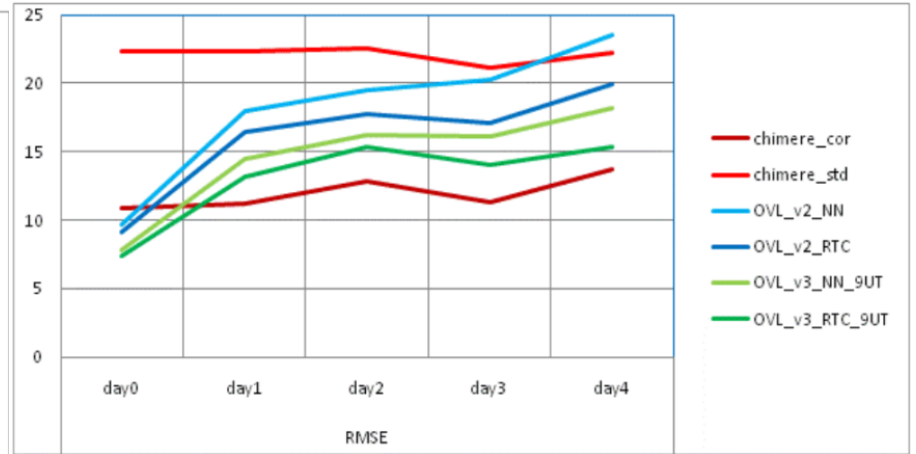

$$SFN = \frac{N1}{N1 + N2}$$

SI: Successindex

$$SI = \frac{N3}{N3 + N4} + \frac{N1}{N1 + N2} - 1 = FCF + SFN - 1$$

Comparison OVL vs. CHIMERE

» Y. Laumans / IRCEL (2010)

Integration of uncertainty...

- » Dealing with observation uncertainty & threshold
 - » Margin of tolerance
 - » Nevertheless, still hard limit
- » What about introducing tolerance on this threshold..
- » Don't count hard exceedances, count probabilities.

For model as well as obs.

Typical tanh – like shape

Additional comments

- » Target value definition

$$\text{Target}_{\text{forecast}_j} = \frac{\sqrt{\frac{1}{N} \sum_{i=1}^N (M_{ji} - O_i)^2}}{\sqrt{\frac{1}{N} \sum_{i=1}^N (O_{i-1} - O_i)^2}} \text{ with } j = i - n, \dots, i$$

$\sigma_o \sqrt{2(1 - \alpha)}$

- » Time lag 1 in normalization → how to treat day+N forecasts ?
- » It become extra difficult for day+2 forecast to perform well
- » → timeseries auto-correlation !
- » However... does it make sense to have a persistence model for lag 3 or 4 ?
- » It would be nice to have an evaluation of the performance vs. forecast horizon.

Conclusions

- » Overall the idea of using persistence model as normalisation is relevant !
 - » Time-lag in normalisation needs to be discussed
- » Target plot quite sensitive to the value of the OU
- » Behaviour of OVL fairly “poor” in target plot... doesn’t reflect our own experience... interesting !
- » Using soft threshold might be more natural way in which to include uncertainty in threshold exceedance indicators
- » As far as threshold indicators go, probably the most important ones are FCF & FFA, or some combination thereof (FCF-FFA)...
