

Ricardo-AEA

An evaluation of the DELTA tool

FAIRMODE Technical Meeting

Oslo, 28-29 April 2014

Presented by: Keith Vincent

Keith Vincent, John Stedman, Daniel Brookes

Outline

- Evaluate outputs from DELTA tool
- Compare with a spreadsheet based tool
- Discuss summary report
- Conclusions

Delta tool (annual formulation)

- Annual MQO
$$MQO = \frac{BLAS}{2U(\bar{O})} \leq 1$$

$$MQO = \frac{BLAS}{2k u_r^{RV} \sqrt{\frac{(1-\alpha)}{N_p^*} (\bar{O}^2) + \frac{\alpha * RV^2}{N_{np}}} \leq 1$$

- Uncertainty parameters for NO₂, PM₁₀ and PM_{2.5}

Source of uncertainty parameters	k	u _r ^{RV}	α	N _p	N _{np}	LV
NO2 Delta v3.6 10 February 2014	2	0.12	0.04	5	12	200
PM10 Delta v3.6 10 February 2014	2	0.14	0.018	40	1	50
PM2.5 Delta v3.6 10 February 2014	2	0.18	0.018	40	1	25

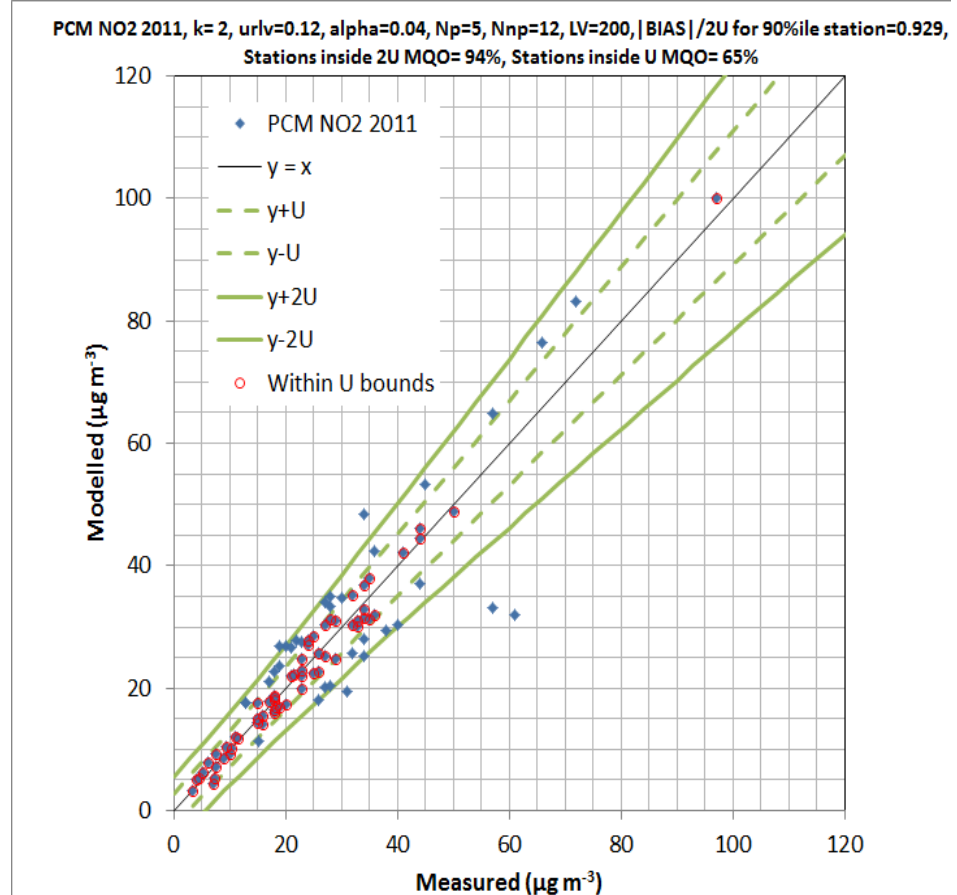

DELTA tool (*Version 3.6*)

- Downloaded from JRC website Feb 2014
- Tested using 2011 measured and modelled concentrations
- ‘PCM’ model – developed for compliance assessment

DELTA tool (NO₂)

 Model (s): PCM
 Parameter: PM25
 Scen: 2011
 Extra Values: No
 Season: Year
 Day hours: All 24h
 Time Average: Preserved
 Daily stats: preserved

PCM PM25 2011, k= 2, urlv=0.18, alpha=0.018, Np=40, Nnp=1, LV=25, |BIAS|/2U for 90%ile station=1.371,
 Stations inside 2U MQO= 79%, Stations inside U MQO= 39%

Uncertainty bounds	Percentage of sites within bounds as calculated by Delta and spreadsheet.	
	Delta tool	Spreadsheet tool
± U	N/A	39 %
± 2U	N/A	79 %

- Uncertainty bounds should be set at $\pm 2U$ not $\pm U$
- PM tool is under development but it would be useful to have parameters for FDMS TEOM
- Treatment of $PM_{2.5}$ appears inconsistent with others pollutants (annual limit value is used as the reference values for daily means)
- Uncertainty parameters could be displayed on scatter plots to enable easy version control

Summary report (NO₂)

A simple display of range in measured concentrations

Apparently one of three MPC not clear why red dot assigned

It is not clear whether these relate to a MPC and where the green and orange thresholds originated from

Disappointed to see RDE still in here

Conclusions (1)

- We were able to ‘verify’ outputs using a spreadsheet for NO₂
- Less success for PM₁₀ and PM_{2.5}
- Would like to see more meta data for DELTA outputs (version control). List parameters to calculate U.
- Need to define ‘success’ for model performance $\pm U$ or $\pm 2U$ in the scatter plot

Conclusions (2)

- Happy with overall approach in introducing measurement uncertainty into MQO
- For annual mean models scatter diagram makes other diagrams redundant
- Coloured 'performance' dots    not helpful
- A quantification of spatial representativity is unlikely to be practical
